

Computer Science 380: Lab Assignment #1

Due on Friday, September 9, 2016

Oliver Bonham-Carter 2:30pm

Daniel Ocampo

Features that a data management tools should provide

(a)

A data mangement tool should organize data in diffrent ways so that user can see diffrent patterns. In the sense that it should organize the the data by letters,length, date and any other revelent reason. Data mangement tool should also keep back ups of data so that if a failure does occur there can be a back up waiting for it to be used. A Data mangement tool should be easy use to save time and effort. A data mangement tool should be able to be used with little memory to keep things fast. A Data mangement tool should be able to work with diffrent types of data. The data mangement should have an effective search tool. A data mangement tool should be able to avoid data redundancy. the data mangement tool should be able filter out good data with bad data, or the very least show data that is the most relevant. The database tool should be able to manage big amounts of data. The reason being is because the there is so much data in consumers everyday spending and figuring out what the user values the most is very crucial. The data mangement tool should also be able to write codes for the user, in the sense that it should just ask for user input and it would convert it into code. The tool should be compatiabile with many diffrent softwares. The tool should also support other languages to make it universal in the sense of countries.
